SPECIAL ISSUE

*Interdisciplinary Perspectives: Contemporary Challenges and Critical
Alternatives in Practical Philosophy and Communication*

Both science and philosophy are essentially grounded in communicability. The same applies to interdisciplinarity: progress in scientific and philosophical research entails a concern for the didactic dimension—that is, for the rigorous formulation of how ideas can be made communicable. Moreover, communicability is always embedded within institutional frameworks, spaces of dissemination, and technical platforms that enable or restrict the circulation of knowledge. In this sense, communicability depends on: a) a verbal formulation or structure that, while maintaining rigour, seeks clarity and intelligibility; and b) a technical and institutional framework that opens or limits channels of diffusion, allowing ideas to be communicated with greater or lesser efficiency, precision, and fidelity.

Satellite communication, the creation of virtual spaces, and the widespread accessibility of mobile devices have dramatically increased communicative efficiency. A recent example can be seen during the COVID-19 pandemic, when digital communication arguably saved the lives of large population sectors. It may well be that, during those two

years of confinement, we witnessed a decade's worth of progress in virtual communication technologies. This leap has shown no regression; today, the capacity to transmit information within microseconds has drastically shortened communicative distance—but only in its technical dimension.

In contrast to the expansion of the technical-institutional network—through access to digital platforms, the rise of content creators, and the availability of editing tools—the communication of ideas has lost in communicability, that is, in its true communicative capacity. This decline results, whether intentionally or not, from the neglect of rigour and didactic form. The proliferation of false or deliberately falsified information, the polarisation of online forums, the lack of physical presence, and the erosion of empathic connection are all phenomena that have given rise to what many describe as the era of post-truth—a time in which reference to truth ceases to matter, or, in other terms, truth no longer functions as a regulative ideal of communication, being replaced instead by the message itself or by its emitter.

In this context, the question concerning the relationship between communicability and the humanities—both from a historical and a co-implicative perspective—becomes increasingly relevant. The humanities are essentially communicative, yet communicability demands a critical and philosophical formulation of its formal and material, structural and technical, institutional and interpersonal conditions.

For this reason, this special issue aims to gather interdisciplinary research that explores the complex relationship of reciprocity and interdependence between communication and practical philosophy, without excluding other areas of the humanities in their theoretical and practical dimensions. Accordingly, we invite researchers from the humanities and social sciences to submit papers that address, from a philosophical or interdisciplinary perspective, one or more of the following themes:

- Communication and practical philosophy: epistemological foundations of communicability
- Ethics of digital communication and media social responsibility
- Truth, post-truth and fake news: challenges for dialogue
- Democracy: deliberation, epistemic justice and political communication
- Critical theory: social issues in the cultural and entertainment industries
- Technology, algorithms and social mediation: power and communicative control
- Communication, education and the digital humanities
- Scientific communication and critical dissemination of knowledge
- Identity, culture and contemporary narratives

We welcome original and unpublished articles employing qualitative, quantitative, or mixed methodologies, as well as theoretical approaches from diverse disciplines such as communication studies, sociology, anthropology, cultural studies, political science, history,

gender studies, philosophy, and pedagogy, among others. We particularly value contributions that include empirical research, data collection, or critically grounded and situated perspectives.

All submissions must be made through the OJS platform hosted on the same site. Author guidelines are available on the Revista Sintaxis website:
